Proposed error analysis

Evaluation categories and diagnostic checks — no measured frequencies shown

1. Output format	**Malformed JSON or schema mismatch**	**Validate the raw model response**
2. Goal interpretation	**Wrong goal, entity, qualifier, or order**	**Compare G_pred with reference goals**
3. Symbolic interface	**Incorrect field or identifier mapping**	**Inspect facts against validated goals**
4. Plan generation	**Unmet task requirements or invalid actions**	**Check constraints and expected effects**

Control: reference goals → CLIPS isolates the symbolic path from neural interpretation
